

## Physics at BESIII: recent highlights

Myroslav Kavatsyuk
KVI, University of Groningen
For the BESIII collaboration

- BESIII and physics goals
- Precision charmonium spectroscopy

## Hadron Landscape

## Hadron-physics challenges:

- Understanding of established states: precision spectroscopy
- Nature of exotic states: search and spectroscopy of unexpected states

BESIII has rich physics and high discovery potential

## BESIII Detector

1.0 Tesla super-conducting magnet

## Muon counters: <br> 9/8 RPC layers (barrel/endcaps)

 Cut-off momentum: $0.4 \mathrm{GeV} / \mathrm{c}$CsI(TI) ElectroMagnetic Calorimeter: $\sigma_{E} / E($ at 1 GeV$)$ : $2.5 \%$ $\sigma_{z, \phi}$ (at 1 GeV ): 6 mm

## Time Of Flight (TOF):

$\sigma_{T}: 100 / 110 \mathrm{ps}$ (barrel/endcaps)
Drift chambers (MDC):

$$
\begin{aligned}
& \sigma_{\mathrm{p}} / \mathrm{p}(\text { at } 1 \mathrm{GeV}): 0.5 \% \\
& \sigma_{\mathrm{dE} / \mathrm{dx}}: 6 \%
\end{aligned}
$$

M. Ablikim et al., Nucl. Instr. and Meth. A 614 (2010) 345-399

## BESIII Milestones

- July 18, 2008 First $\mathrm{e}^{+} \mathrm{e}^{-}$collision event in BESIII
- Apr. 14, $2009 \sim 108$ M $\Psi '$ events

$$
\sim 4 \times \text { CLEO-c }
$$

$\sim 42 \mathrm{pb}^{-1}$ at 3.65 GeV )

- July 28, 2009
$\sim 225 \mathrm{M} \quad \mathrm{J} / \Psi$ events
$\sim 4 \times$ BESII
- 2010-2011
- May 2011
~ $2.9 \mathrm{fb}^{-1} \quad \Psi^{\prime \prime}$
~ $11 \times$ CLEO-c
$\sim 70 \mathrm{pb}^{-1} \quad$ scanning of the $\Psi$ " region
$\sim 0.5 \mathrm{fb}^{-1} \quad 4.01 \mathrm{GeV}$ ( $\mathrm{D}_{\mathrm{s}}$ and XYZ spectroscopy)
~ 0.4 B $\quad \Psi^{\prime}$ events
~ $16 \times$ CLEO-c
$\sim 1 \mathrm{~B} \quad \mathrm{~J} / \Psi$ events $\sim 18 \times \mathrm{BESII}$
- 2013

$$
\begin{aligned}
\sim 525 \mathrm{pb}^{-1} & \mathrm{E}_{\mathrm{cm}}=4.26 \mathrm{GeV} \\
\sim 520 \mathrm{pb}^{-1} & \mathrm{E}_{\mathrm{cm}}=4.36 \mathrm{GeV} \\
\sim 0.8 \mathrm{fb}^{-1} & \mathrm{E}_{\mathrm{cm}}=4.26 \mathrm{GeV}
\end{aligned}
$$

Record Luminosity so far: $7 \times \mathbf{1 0}^{\mathbf{3 2}} \mathbf{c m}^{-2} \mathbf{s}^{-1}(8 \times$ CESRc or $45 \times$ BEPC $)$

High luminosity, clean environment

Access to weakly populated channels of particular interest

## Precision charmonium spectroscopy

## Charmonium Physics

Charmonium (a bound state of cc quarks) bridge between perturbative and strong QCD

Strong-interaction coupling constant

Precise data on the key charmonium states and transitions

Insight into the strong interactions at long-distance scales (test of Potential models, lattice QCD, EFT)

## State Properties as a Probe

Precise measurement of charmonium masses and widths

Mass [MeV]

Test of potential models and lattice QCD

## Potential model: if P-wave

 spin-spin interaction is non-zero:$\Delta \mathrm{M}_{\mathrm{hf}}(1 \mathrm{P})=\mathrm{M}\left(\mathrm{h}_{\mathrm{c}}\right)-\left\langle\mathrm{m}\left(1^{3} \mathrm{P}_{\mathrm{J}}\right)\right\rangle \neq 0$
$\left\langle m\left(1^{3} P_{J}\right)\right\rangle=\sum_{J=0}^{2} M_{\chi c J}(2 J+1) / 9$
Expected value $\Delta M_{h f}(1 P)=0$

Hyperfine splitting: $\mathbf{M}(\mathbf{J} / \Psi)-\mathbf{M}\left(\eta_{\mathrm{c}}\right)$ : important input to test lattice QCD, dominated by error on $M\left(\eta_{c}\right)$ !

LQCD prediction:
$\Delta M(1 S)=116.5 \pm 3.2 \mathrm{MeV}$
[Phys. Rev. D 86, 094501 (2012)]

## State Properties as a Probe

Mass and width measured with comparable or better precision:
$\eta_{\mathrm{c}}{ }^{\prime}(3638)$
[Phys. Rev. Lett. 109, 042003 (2012)]

- $M=3637.6 \pm 2.9 \pm 1.6 \mathrm{MeV}$
- $\Gamma=16.9 \pm 6.4 \pm 4.8 \mathrm{MeV}$
$h_{c}$ (3525)
[Phys. Rev. Lett. 104, 132002 (2010)]
- $M=3525.40 \pm 0.13 \pm 0.18 \mathrm{MeV}$
- $\Gamma=0.73 \pm 0.45 \pm 0.28 \mathrm{MeV}$
first measurement!
[Phys. Rev. D 86, 092009 (2012)]
- $\mathrm{M}=3525.31 \pm 0.11 \pm 0.14 \mathrm{MeV}$
$\cdot \Gamma=0.7 \pm 0.28 \pm 0.22 \mathrm{MeV}$
$\eta_{\mathrm{c}}$ (2980)
[Phys. Rev. Lett. 108, 222002 (2012)]
- $M=2984.3 \pm 0.6 \pm 0.6 \mathrm{MeV}$ understood resonance shape!
- $\Gamma=32.0 \pm 1.2 \pm 1.0 \mathrm{MeV}$ [Phys. Rev. D 86, 092009 (2012)]
- $M=2984.49 \pm 1.16 \pm 0.52 \mathrm{MeV}$
- $\Gamma=36.4 \pm 3.2 \pm 1.7 \mathrm{MeV}$

## State Properties as a Probe

Precise measurement of charmonium masses and widths

Mass [MeV]

Test of potential models and lattice QCD

## Potential model: if P-wave

 spin-spin interaction is non-zero:$$
\begin{aligned}
\Delta \mathrm{M}_{\mathrm{hf}}(1 \mathrm{P}) & =\mathrm{M}\left(\mathrm{~h}_{\mathrm{c}}\right)-\left\langle\mathrm{m}\left(1^{3} \mathrm{P}_{\mathrm{J}}\right)\right\rangle \neq 0 \\
\left\langle m\left(1^{3} P_{J}\right)\right\rangle & =\sum_{J=0}^{2} M_{\chi c J}(2 \mathrm{~J}+1) / 9
\end{aligned}
$$

$\Delta M_{h f}(1 P)=-0.19 \pm 0.11 \pm 0.14 \mathrm{MeV}$ Consistent with zero!

Hyperfine splitting: $\mathbf{M}(\mathbf{J} / \Psi)-\mathbf{M}\left(\boldsymbol{\eta}_{\mathrm{c}}\right)$ : important input to test lattice QCD, dominated by error on $M\left(\eta_{c}\right)$ !
$\Delta \mathrm{M}(1 \mathrm{~S})=112.5 \pm 0.8 \mathrm{MeV}$ Good agreement with LQCD Better precision than LQCD!

## $\Psi^{\prime} \rightarrow \tau^{0} \cap_{c} \cap_{c} \rightarrow \prod_{c}$

- $\eta_{c}$-resonance: interference with non-resonant backgrounds $\rightarrow$ difficult to measure
- Only recently consistent results were obtained [ Phys. Rev. Lett. 102, 011801 (2009), Phys. Lett. B 706, 139 (2011), Phys. Rev. D 84, 012004 (2011),

Phys. Rev. Lett. 108, 222002 (2012)]

[Phys. Rev. Lett. 108, 222002 (2012)]

- $h_{c} \rightarrow \gamma \eta_{c}$ E1 transition:
small non-resonant background $\rightarrow$ the $\eta_{c}$ line shape is less distorted
- Consistent and precise measurement of $h_{c}$ and $\eta_{c}$ parameters
- Determined branching ratios for 16 exclusive $\eta_{c}$ decays ( 5 measured for the first time)

[Phys. Rev. D 86, 092009 (2012)] 10

## Transitions as a Probe

- In the potential approach:
$R=\frac{\Gamma(J / \Psi \rightarrow \gamma \gamma \gamma)}{\Gamma(J / \Psi \rightarrow e e)}=\frac{64\left(\pi^{2}-9\right)}{243 \pi} \alpha\left(1-7.3 \frac{\alpha_{s}}{\pi}\right)$
[M. B. Voloshin, Prog. Part. Nucl. Phys. 61, 455 (2008)] assuming $\alpha_{\mathrm{s}}=0.19 \rightarrow R=3 \times 10^{-4}$
- The rates ratio - sensitive only to QCD radiative corrections:

Test of understanding of the QCD radiative effects

- $\mathrm{B}(\mathrm{J} / \Psi \rightarrow 3 \gamma)=(11.3 \pm 1.8 \pm 2.0) \times 10^{-6}$
- $B\left(\eta_{c} \rightarrow 2 \gamma\right)=(2.6 \pm 0.7 \pm 0.7) \times 10^{-4}$

Measured $R=(1.95 \pm 0.37) \times 10^{-4}$
Consistent with the CLEOc result:

$$
R=(2.0 \pm 0.6) \times 10^{-4}
$$

$\Psi^{\prime} \rightarrow \pi^{+} \pi^{-} J / \Psi \rightarrow \gamma \gamma \gamma$
$\Psi^{\prime} \rightarrow \pi^{+} \pi^{-} \mathrm{J} / \Psi \rightarrow \gamma \eta_{\mathrm{c}} \rightarrow \gamma \gamma$
Two-photon mass

[ Phys. Rev. D87 032003 (2013)]

Measurement of transition rates yields necessary information for development of models

## Transitions as a Probe

## Transition rates measured with better

 precision or for the first time: $\quad B\left(\Psi^{\prime} \rightarrow \gamma \eta_{c}{ }^{\prime} \rightarrow K K \pi\right)=$$(1.30 \pm 0.20 \pm 0.30) \times 10^{-5}$
[Phys. Rev. Lett. 109, 042003 (2012)]
$B\left(\Psi^{\prime} \rightarrow \pi^{0} h_{c}\right)=(8.4 \pm 1.3 \pm 1.0) \times 10^{-4}$
$B\left(h_{c} \rightarrow \gamma \eta_{c}\right)=(54.3 \pm 6.7 \pm 5.2) \%$
[Phys. Rev. Lett. 104, 132002 (2010)]
$\mathrm{B}\left(\Psi^{\prime} \rightarrow \gamma \mathrm{J} / \Psi\right)=$
$(3.3 \pm 0.6+0.8-1.1) \times 10^{-4}$
[Phys. Rev. Lett 109, 172002 (2012)]
$\Gamma\left(\chi_{\mathrm{c} 2} \rightarrow \gamma \gamma\right)=0.63 \pm 0.04 \pm 0.04 \mathrm{keV}$
$\Gamma\left(\chi_{c o} \rightarrow \gamma \gamma\right)=2.33 \pm 0.20 \pm 0.13 \mathrm{keV}$ [Phys. Rev. D 85, 112008 (2012)]
BESIII can access suppressed transitions of interest Talk by Olga Bondarenko
(Thursday, 14:30)

## Exotic hadron matter

## Other QCD Exotic Objects

QCD predicts exotic objects:

- hybrids (resonances of quark-antiquark and excited glue)
- glueballs (excited states of glue)

Glueballs and hybrids properties are determined by the long-distance features of QCD

Insight into
QCD vacuum 14

# Glueball Searches with BESIII PWA of J/ $\Psi \rightarrow \gamma \eta \eta$ 

Radiative J/ $\Psi$ decay - a gluon-rich process $\rightarrow$
one of the most promising hunting grounds for glueballs

| Resonance | Mass $\left(\mathrm{MeV} / c^{2}\right)$ | Width $\left(\mathrm{MeV} / c^{2}\right)$ | $\mathcal{B}(J / \psi \rightarrow \gamma X \rightarrow \gamma \eta \eta)$ | Significance |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $f_{0}(1500)$ | $1468_{-15-74}^{+14+23}$ | $136_{-26-100}^{+41+28}$ | $\left(1.65_{-0.31-1.40}^{+0.26+0.51}\right) \times 10^{-5}$ | $8.2 \sigma$ |
| $f_{0}(1710)$ | $1759 \pm 6_{-25}^{+14}$ | $172 \pm 10_{-16}^{+32}$ | $\left(2.35_{-0.11-0.74}^{+0.13+1.24}\right) \times 10^{-4}$ | $25.0 \sigma$ |
| $f_{0}(2100)$ | $2081 \pm 13_{-36}^{+24}$ | $273_{-24-23}^{+27+70}$ | $\left(1.13_{-0.10-0.28}^{+0.09+0.64}\right) \times 10^{-4}$ | $13.9 \sigma$ |
| $f_{2}^{\prime}(1525)$ | $1513 \pm 5_{-10}^{+4}$ | $75_{-10-8}^{+12+16}$ | $\left(3.42_{-0.51-1.30}^{+0.43+1.37}\right) \times 10^{-5}$ | $11.0 \sigma$ |
| $f_{2}(1810)$ | $1822_{-24-57}^{+29+66}$ | $229_{-42-155}^{+52+88}$ | $\left(5.40_{-0.67-2.35}^{+0.60+3.42}\right) \times 10^{-5}$ | $6.4 \sigma$ |
| $f_{2}(2340)$ | $2362_{-30-63}^{+31+140}$ | $334_{-54-100}^{+62+165}$ | $\left(5.60_{-0.65-2.07}^{+0.62+2.37}\right) \times 10^{-5}$ | $7.6 \sigma$ |

[arXiv:1301.0053, Accepted by PRD]

- Scalar contributions mainly from $f_{0}(1500), f_{0}(1710)$ and $f_{0}(2100)$
- Production rate of $f_{0}(1710)$ consistent with predicted glueball production [Phys. Rev. Lett. 110, 021601 (2013)] $\rightarrow$
$\mathrm{f}_{0}(1710)$ has a larger overlap with the glueball compared to other glueball candidates

## Mysterious XYZ States...

... unexpectedly narrow for mesons in the open-charm region, strongly coupled to charmonium: What is their nature?

| State | $m(\mathrm{MeV})$ | $\Gamma(\mathrm{MeV})$ | $J^{P C}$ | Process (mode) | Experiment (\# $\#$ ) | Year | Status |

## Studies of $Y(4260)$ at BESIII

## $\mathrm{Y}(4260)$ :

- Does not fit any potential model.
- Has a small coupling to open charm
- $\mathrm{J}^{\mathrm{PC}}=1^{-}$
- A hybrid candidate according to Lattice QCD calculations! [JHEP 1207, 126 (2012)]

[Phys. Rev. Lett. 110, 252001 (2013)]

## Dalitz Plot: $\mathbf{e}^{+} \mathbf{e}^{-} \rightarrow \pi^{+} \pi^{-} \mathrm{J} / \psi$

- Clear peak at $3.9 \mathrm{GeV}: \mathrm{Z}_{\mathrm{c}}{ }^{ \pm}(3900)$,
- Peak at lower energy -
kinematic reflection
(changes its position
with $\mathrm{e}^{+} \mathrm{e}^{-} \mathrm{CM}$ energy)
$Y(4260)$

$\pi^{\mp}$

## The $Z_{c}(3900)$

- Fit with S-wave Breit-Wigner
- $M=(3899.0 \pm 3.6 \pm 4.9) \mathrm{MeV} / \mathrm{c}^{2}$
- $\Gamma=(46 \pm 10 \pm 20) \mathrm{MeV}$
[Phys. Rev. Lett. 110, 252001 (2013)]
Discovered by BESIII, promptly confirmed by:

Belle: [Phys. Rev. Lett. 110, 252002 (2013)]
$\mathrm{M}=3894.5 \pm 6.6 \pm 4.5 \mathrm{MeV} / \mathrm{c}^{2}$
$\Gamma=63 \pm 24 \pm 26 \mathrm{MeV}$

Cleo-c: [arXiv:1304.3036]

## Mysterious XYZ States...

... unexpectedly narrow for mesons in the open-charm region, strongly coupled to charmonium: What is their nature?

Z states:

- Charged states
- Strongly coupled to charm

## can not be conventional mesons

## Nature of the Z (3900) Most popufar models

Tetraquark

Interact by gluonic color force [arXiv:1303.6857]
[arXiv:1304.0345, 1304.1301]

Hadronic molecule

2 color-neutral mesons Interact by pion exchange [arXiv:1303.6608] [arXiv:1304.2882, 1304.1850]
[arXiv: 1304.0380]
Other models:

- Meson loop [arXiv: 1303.6355, 1304.4458]
- Initial State Pion Emission (ISPE) model [arXiv: 1303.6842, 1304.5845]

## Nature of the $Z_{c}(3900)$

## Sensitive probes?

- Heavier/lighter states
- Hadronic molecule [PRD 77, 014029 (2008)]

- Tetraquark [arXiv:1303.6857]

- Decay modes and rates
- Hadronic molecule:
decays mainly to its constituents
- Tetraquark: $\Gamma\left(Z_{c}^{+} \rightarrow \pi^{+} J / \psi\right) \approx 29 \mathrm{MeV}$

Measurement coming soon... Stay tuned!

$$
\Gamma\left(Z_{\mathrm{c}}^{+} \rightarrow \mathrm{D}^{+} \overline{\mathrm{D}}^{00}, \overline{\mathrm{D}}^{0} \mathrm{D}^{+\dagger}\right) \approx 4 \mathrm{MeV}
$$

## A lot of interesting results are already published by the BESIII collaboration

New exciting results are coming soon!

## Summary

- BESIII is operational since 2008 and already has world's largest data samples of various Y and charmonium states
- BESIII - an ideal tool for precision studies of suppressed channels:
- clean environment
- well controlled systematics
- A lot of interesting results have been obtained:
- Precise measurements of resonance properties
- Discovery of unexpected states
- ... and we are looking forward to the future:
- More data available than presented in current analysis

## Stay tuned!

## Thank you for your attention and to the BESIII collaboration!

BESIII collaboration: >360 members in 53 institutions from 11 countries

## Physics at BESIII

## Charm physics:

- (semi)leptonic + hadronic decays
- decay constant, form factors
- CKM matrix: Vcd, Vcs
- $\mathrm{D}_{0}-\mathrm{D}_{0}$ mixing and CP violation
- rare/forbidden decays

## Charmonium physics:

- transitions and decays
- spectroscopy of exotic states

Light hadron physics:

- meson \& baryon spectroscopy
- glueball \& hybrid
- two-photon physics
- e.m. form factors of nucleon

Tau physics:
systematics under control $\rightarrow$ high precision

- tau decays near threshold
- tau mass scan

## Dalitz Plot: $\mathbf{e}^{+} \mathbf{e}^{-} \rightarrow \pi^{+} \pi^{-} \mathrm{J} / \psi$

- Decay via $\mathrm{f}_{0}(980)$ and $\sigma(500)$
- No peak is generated by these resonances in the $\pi^{+} J / \Psi$ spectrum
