Recent BESIII results

Thursday 13 Oct 2011 at 09:00 (00h35')

Content :

The BESIII detector, built at the Beijing Electron Positron Collider II (BEPC-II), is a powerful facility to study physics in the energy range up to 4.6 GeV, with a broad research program covering charmonium physics, D-physics, spectroscopy of light hadrons and tau-physics. BESIII has started to take data in 2008 and it has already collected a statistics of $226 \cdot 10^6$ J/Psi and $106 \cdot 10^6$ Psi' events, the world largest data sample on these charmonium states. Based on these data, recent results will be here presented.
